

CASE STUDY: The RACR Framework (Risk-Adjusted Cost Recovery)

Role: Technical Lead / Solutions Consultant

Impact: \$273.7M Projected Operational Savings

Domain: Automated GRC (Governance, Risk, and Compliance) & ServiceNow Ecosystem

I. THE CHALLENGE: The High Cost of Manual Oversight

The Commonwealth of Virginia faced a massive "Data Silo" crisis. Critical compliance data was trapped in fragmented legacy systems, requiring hundreds of manual labor hours to reconcile for federal audits.

- **The Problem:** Inconsistent risk reporting and manual "Spreadsheet-based" auditing.
- **The Risk:** Potential loss of federal funding and extreme vulnerability to regulatory penalties.
- **The Financial Burden:** An estimated **\$273.7M** in operational leakage due to manual inefficiencies and unrecovered costs over the project lifecycle.

II. THE ENGINEERING: Building the "Connective Tissue"

To solve this, I didn't just implement a tool; I architected a **Digital Thread** that automated the lifecycle of risk and recovery.

1. The Orchestration Layer

I utilized the ServiceNow GRC module as the foundation, but extended it using custom automation logic to bridge the gap between financial databases and compliance dashboards.

- **Automated Data Ingestion:** Replaced manual entry with scheduled API-driven imports from core financial systems.
- **Dynamic Risk Scoring:** Developed an algorithmic approach to "Risk-Adjusted" calculations, moving from static yearly assessments to real-time status updates.

2. The RACR Dashboard

I designed a "Single Source of Truth" for executive stakeholders that visualized:

- Real-time compliance posture across 100+ agencies.
- Automated alerts for high-risk variances.

- Direct mapping of technical failures to dollar-amount impacts.

III. THE OUTCOME: Measurable Business Value

The RACR implementation transformed the Commonwealth's GTM (Go-To-Market) for internal services, turning a cost center into an efficiency engine.

- **Financial Impact:** Identified and protected **\$273.7M** in project-based savings through rigorous automated oversight.
- **Labor Efficiency:** Reduced manual audit preparation time by approximately **65%**, allowing senior staff to focus on strategic risk mitigation rather than data entry.
- **Audit Readiness:** Achieved a "Continuous Compliance" state, reducing the lead time for federal reporting from months to days.

IV. TECHNICAL STACK & METHODOLOGY

- **Platform:** ServiceNow (GRC, IRM, ITOM).
- **Integration:** RESTful APIs, MID Server Orchestration.
- **Strategy:** RACR (Risk-Adjusted Cost Recovery) Framework.
- **AI Augmentation:** Utilized LLMs to synthesize 200+ page federal policy documents into automated "Compliance Checklists."

V. REFLECTION: The Mutability Factor

While this project was built within the ServiceNow ecosystem, the core achievement was **Architectural Interoperability**. The same logic used to save \$273M for a government entity—mapping complex data to financial outcomes—is the methodology I bring to every Enterprise Tech Sales cycle.

"I don't just solve for the technical 'How'; I solve for the economic 'Why'."

AI Disclosure

This case study highlights a real-world project executed by Rheonda Ogletree. The documentation and data visualization strategy were refined using Google Gemini to ensure maximum clarity for executive and technical stakeholders.
